Data included in this report were obtained by the agencies named above in cooperation with Federal, State and private organizations listed inside the back cover of this report.

AS OF
FEB. 1, 1975

TO RECIPIENTS OF WATER SUPPLY OUTLOOK REPORTS:

Most of the usable water in western states originates as mountain snowfall. This snowfall accumulates during the winter and spring, several months before the snow melts and appears as streamflow. Since the runoff from precipitation as snow is delayed, estimates of snowmelt runoff can be made well in advance of its occurrence. Streamflow forecasts published in this report are based principally on measurement of the water equivalent of the mountain snowpack.

Forecasts become more accurate as more of the data affecting runoff are measured. All forecasts assume that climatic factors during the remainder of the snow accumulation and melt season will interact with a resultant average effect on runoff. Early season forecasts are therefore subject to a greater change than those made on later dates.

The snow course measurement is obtained by sampling snow depth and water equivalent at surveyed and marked locations in mountain areas. A total of about ten samples are taken at each location. The average of these are reported as snow depth and water equivalent. These measurements are repeated in the same location near the same dates each year.

Snow surveys are made monthly or semi-monthly from January 1 through June 1 in most states. There are about 1900 snow courses in Western United States and in the Columbia Basin in British Columbia. Networks of automatic snow water equivalent and related data sensing devices, along with radio telemetry are expanding and will provide a continuous record of snow water and other parameters at key locations.

Detailed data on snow course and soil moisture measurements are presented in state and local reports. Other data on reservoir storage, summaries of precipitation, current streamflow, and soil moisture conditions at valley elevations are also included. The report for Western United States presents a broad picture of water supply outlook conditions, including selected streamflow forecasts, summary of snow accumulation to date, and storage in larger reservoirs.

Snow survey and soil moisture data for the period of record are published by the Soil Conservation Service by states about every five years. Data for the current year is summarized in a West-wide basic data summary and published about October 1 of each year.

PUBLISHED BY SOIL CONSERVATION SERVICE

The Soil Conservation Service publishes reports following the principal snow survey dates from January 1 through June 1 in cooperation with state water administrators, agricultural experiment stations and others. Copies of the reports for Western United States and all state reports may be obtained from Soil Conservation Service, West Technical Service Center, Room 111, 511 N.W. Broadway, Portland, Oregon 97209.

Copies of state and local reports may also be obtained from state offices of the Soil Conservation Service in the following states:

STATE	ADDRESS

WINTER SCENE

SCS PHOTO

ALASKA SUMMARY as of FEBRUARY 1, 1975

Snowfall in the South Central region of the state has been heavy this winter. Snow surveys as of about February 1 indicate that some areas have already accumulated more snow than they normally get throughout the entire winter. None of the watersheds where surveys are conducted are deficient in snowpack at this time.

The area by area report is as follows:

TANANA-CHENA DRAINAGES

The snowpack at lower elevations is well above average with more nearly normal accumulations at mid and high elevations. Streamflow forecasts will be made beginning March 1.

COPPER DRAINAGE

The Copper drainage has nearly 50 percent more snow than normal for February 1. This year's accumulation is more than twice the amount that was measured last year on February 1.

MATANUSKA-SUSITNA DRAINAGES

The Susitna watershed snow courses all have very heavy snowpacks - as much as 50 percent greater than average and almost twice last year's level. At Willow and Talkeetna the February 1 snowpack water content exceeded the average season-long maximum.

Matanuska drainage surveys were limited this month but indicate that a heavy buildup has occurred there also.

UPPER COOK INLET DRAINAGES

Much of Arctic Valley and the Campbell Creek area has a heavier snowpack now than they normally have at any time in the winter. Higher in the mountains along Ship Creek, the snowpack is only slightly above normal.

Area-wide, the snowpack is 34 percent heavier than normal and 55 percent more than last year.

KENAI PENINSULA DRAINAGES

The snowpack in this area is about 20 percent over the February 1 normal. The accumulation last year was near the average for February 1.

SOUTHEASTERN DRAINAGES

The relatively new network near Ketchikan has about the same snowpack accumulation as last year.

LEGEND

- * Numerals 1,2,3,4,5, and 6 refer to January 1, February 1, March 1, April 1, May 1, June 1, and 7 - for special dates.
- * Letters refer to Agency that secures the snow survey, as follows:
- a. Soil Conservation Service
 - b. Forest Service
 - c. U.S. Army Corps of Engineers
 - d. U.S. Army Cold Regions Research & Eng. Lab
 - e. Alaska Power Administration
 - f. Bureau of Land Management
 - g. U.S. Geological Survey
- * Letters following the snow course no. refer to:
- * A. Snow course and aerial stadia marker
 - * a. Aerial stadia marker only
 - M. Soil Moisture Station
 - P. Precipitation Storage Gage
 - S. Snow Pillow
